WHY MANAGE THE RISK WHEN WE CAN REDUCE IT?

Argyle™ **Fistula Cannula** for haemodialysis

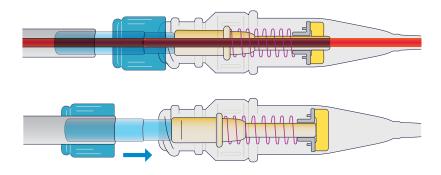

ARGYLE™ SAFETY FISTULA CANNULA FOR HAEMODIALYSIS

AUTOMATICALLY ACTIVATED ANTI-REFLUX VALVE

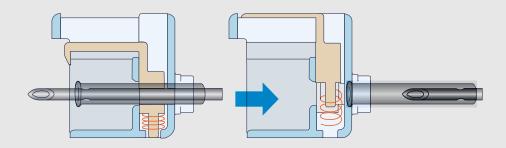

There is no need to clamp the device to prevent blood flow, which will be automatically activated upon connection to blood lines or a syringe.

The blood line male luer pushes the slide core inside the cannula forwards, which pushes the anti-reflux valve open, and the blood passes through the slide core.

DESIGNED TO PREVENT NEEDLE-STICK INJURIES

An integrated safety needle-stick prevention mechanism covers automatically the needle tip when the puncture needle is removed. There is no need for the clinician to activate the safety mechanism.

Integrated safety needle-stick prevention mechanism
